

# TIO 1 – Creating EC2 instance and accessing it via internet

## Steps:

1. Open EC2 console and select launch instances.
2. Add the details in the fields (image1 – image 3) and select create instance.
3. Once the instance is created, select the checkbox near the instance name and copy the PUBLIC IPv4 address and paste in another browser tab and go.
4. Once done terminate the instance.

# TIO 2 – Creating Load Balancers and Target Groups

## Steps:

1. Open EC2 console, select launch instances and create another EC2 instance(Image 1)
2. Open target group and create a target group by including both the EC2 instances(Image 2)
3. Open load balancer and create a load balancer and attach the target group.
4. Once created copy the DNS and paste in separate tab and keep refreshing.The tab changes between both instances(Image 3)
5. Once done terminate the instance(Image 4)
